

Pelican Technologies Zooms in to Deliver Cutting Edge Event Detection Solutions

DAYTON, OH (February 23, 2010) – Pelican Technologies proudly announces the release of their newest security product, HawkEye; this innovative security solution is an automated camera tasking system that directs the movement of Pan-Tilt-Zoom cameras based on external event detection. Pelican's CEO, Gary Moore, says, "this product is ideal to support surveillance efforts in urban environments, corporate campuses, and government facilities – trumping other systems by allowing users to follow events as they happen."

Pelican Technologies also reports that the HawkEye System will sync with the IP networks of existing cameras and event detection systems. This advanced technology prioritizes inputs, determines which cameras need to be tasked to which location, directs movement of those cameras, and alerts existing Video Management Systems. Configuration logic determines camera-tasking activity based on GPS position of detected events; configurable prioritization of inputs allows users to determine which detected events are most important.

HawkEye features much more than camera controls. This dynamic product has the ability to control gates, signs and doors in addition to cameras. It also boasts point and click administration, the ability to alternate locations, the ability to control unlimited cameras, event prioritization, output camera tasking to Video Management Systems and Computer Aided Dispatch, and remote alert. Product support, license support, upgrades, installation and issue resolutions are all provided by Pelican Technologies.

Pelican Technologies has been providing custom developed software solutions for business and consulting services since 2005. Pelican's rapid development and deployment environment is their key to success. By managing a global network of experts in organizational theory, efficiency, mathematics, software engineering, database design, Internet technologies, marketing, hardware development and systems integration, Pelican Technologies routinely moves from concept to deployment in a fraction of the time most other firms require.
